The Market for U.S. Cotton in the Republic of Korea

THE MARKET FOR U.S. COTTON IN THE REPUBLIC OF KOREA

By

Robert B. Evans¹

Summary and Conclusions

In the 5 years ending July 1978, the Republic of Korea (South Korea) was the most rapidly expanding market for cotton in the world. Cotton imports rose from 484,000 bales in 1972/73 to 1,312,000 in 1977/78, and will likely approximate this figure again in 1978/79 (unless otherwise indicated, bales are 480 lb net). South Korea in 1978/79 ranks third, after Japan and the People's Republic of China, as an importer of cotton.

South Korea is unique as a major importer in that it purchases all but 2 to 5 percent of its cotton requirements annually from the United States. In 1977/78 it was the largest single export market for U.S. cotton, taking 1,231,000 bales, or one of every 4.4 cotton bales that the United States exported. Cotton sales to South Korea alone made a positive contribution of \$352.4 million to the U.S. balance of payments that year.

Most of the cotton imported by South Korea during earlier years was financed under U.S. Government programs. Commodity Credit Corporation (CCC) credit has been the principal means since 1970/71 and Korea has never defaulted on these 3-year commercial credits. Several hundred thousand bales annually are now being paid for directly with Korean foreign exchange.

South Korea typically purchases U.S. cotton of average and longer staple length. U.S. sales consist mostly of Deltapine cotton from Arizona and the Imperial Valley of California, although there is some Acala cotton from the San Joaquin Valley in California and a considerable volume of shorter staple cotton from west Texas and Oklahoma. The cotton is

mostly exported from Los Angeles and San Francisco.

South Korea probably can produce cotton textiles at a lower cost than any other country in the world. Its rapidly expanding textile industry is characterized by large units of new machinery working at full capacity, and efficient labor working at relatively low wage rates.

Only about one-fourth of South Korea's mill consumption of cotton goes into products for domestic consumption. The quantity of cotton used for this purpose remained stationary at about 285,000 bales annually from 1970 to 1977. There was a substantial increase, however, in the first half of 1978 because of general prosperity, rising per capita incomes, and changes in Government policies that may have previously favored domestically made synthetics.

Cotton's proportion of the aggregate domestic market for both cotton and manmade fibers in South Korea is estimated to have fallen from 72 percent in 1965 to 28 percent in 1977, but to have recovered to 34 percent in the first half of 1978. Per capita consumption of cotton was 1.8 kilograms during 1970-72 and 1.9 in 1976-78. Per capita consumption of manmade fibers rose from 2.2 to 4.1 during the same period.

An estimated 74 percent of South Korea's cotton consumption went into export products in 1977. Consumption of cotton going into exported textiles rose from 84,000 bales in 1965 to 796,000 in 1977 and was running at the annual rate of 863,000 bales in the first half of 1978.

South Korea is primarily an exporter of cotton goods in process that require further manufacture elsewhere. Yarn—accounting for nearly half of the exports of cotton manufactures—goes almost entirely to Hong Kong and Japan. Fabrics account for 46 percent, with Western Europe taking most of the volume, although significant exports also go to Hong Kong, Japan, and the United States. Within this category goods that are mostly synthetic but part

¹Mr. Evans, now retired, was an agricultural economist with the Tobacco and Cotton Division, Commodity Programs, Foreign Agricultural Service, U.S. Department of Agriculture.

cotton are now more important quantitywise than all cotton goods. Made-up goods comprise only 5 percent of cotton product exports, with the United States, the European Community, and Japan the leading destinations.

Only 4 percent of U.S. imports of cotton manufactures come directly from South Korea, although undoubtedly additional quantities were further processed in Hong Kong, Japan, and elsewhere before arriving in the United States. Manmade fiber manufactures are much more important than all cotton products in South Korea's direct export trade with the United States. In 1977/78, around 13 percent of U.S. imports of these products were from South Korea.

Only 6 percent of cotton yarn exported by the world's major exporting countries originated in 1976 in South Korea, and only 3 percent of the fabric. Thus, South Korea with its highly efficient industry should have considerable scope for further expansion. Its competitive situation in the world textile market has been improved greatly by the rising value of the Japanese yen, which has placed Japanese export textiles at a competitive disadvantage.

South Korea's textile exports to nearly all developed countries are subject to quotas that allow a moderate year-to-year expansion. Exports to many other countries are held down by foreign exchange restrictions, state trading, tariff barriers, subsidies to local industry, and other measures to discourage

textile imports. It is Korean policy to diversify and upgrade the quality of its textile exports and to expand its markets in many additional countries.

Although Korea's labor costs are still low, compared with many other major textile-producing countries, they are rising as the country's labor force becomes more fully utilized and trained for more and more technically sophisticated operations. Average earnings by textile and apparel workers grew 28 percent in 1977 and 21 percent in the first half of 1978. Textile unions were demanding a 50-percent increase in 1979. A principal concern in South Korea is rising competition from the People's Republic of China.

Unquestionably of great benefit to U.S. cotton farmers, ginner, merchants, and cooperatives is the near monopoly enjoyed by the United States in South Korea's larger and expanding import market for cotton, combined with South Korea's ability to

process cotton into textiles at low cost for export to countries where very little U.S. raw cotton now is sold.

Production

In 1949 and again in 1951, the Republic of Korea grew over 100,000 bales of cotton, but since then, production has declined and only 9,000 bales were grown in 1977. This cotton is of poor quality and is used by farmers for their own consumption rather than for commercial spinning.

Imports

In 1977/78, the Republic of Korea was the world's third largest importer of cotton from all sources, surpassed only by Japan and the People's Republic of

China. Annual imports exceeded 100,000 bales for the first time in 1954/55, exceeded 500,000 bales in 1970/71, and passed the 1.0-million-bale mark in 1975/76. In 1977/78, imports totaled over 1.3 million bales (table 2). South Korea is now a larger market for raw cotton than such countries as France, West Germany, and the United Kingdom.

A Leading Export Market for U.S. Cotton

Japan for many years was the leading export market for U.S. cotton, but now may be surpassed in this position by the Republic of Korea. U.S. cotton exports to South Korea moved ahead of shipments to Japan for the first time in 1975/76 and again in 1977/78. In the three cotton seasons ending July 31, 1978, 1 of every 4.4 cotton bales exported by the United States went to South Korea (table 3). In 1978/79, August 1 through July 22, U.S. exports plus outstanding sales of Upland cotton to Japan of 1,496,500 running bales, however, were ahead of sales to the Republic of Korea of 1,411,700 bales.

U.S. cotton exports to South Korea doubled from an average of 614,000 bales during 1970/71-74/75 to 1,231,000 bales in 1977/78. This was by far the largest gain to any country. Cotton exports to South Korea, therefore, make a considerable contribution to the U.S. balance of payments. During 1977/78 they were valued at \$352.4 million.

Prospective U.S. Exports. It is expected that 1979/80 will be another good year for U.S. cotton exports to South Korea. From August 1, 1978 through July 22, 1979, the United States already had sold 545,000 running bales of Upland cotton for delivery in 1979/80, compared with 536,700 to Japan and 2,475,800 to all countries.

The Korean Government estimated its cotton import requirements at 1.2 million bales for calendar 1978, 1.4 million bales in 1979, and 1.5 million in 1980 and 1981.

There is no other major cotton import market in which U.S. cotton has so preponderant a share as South Korea. All but 2 to 5 percent of its imports of cotton have come from the United States in recent years. Imports from all other countries averaged only 31,000 bales annually from 1973/74 through 1977/78. A few thousand bales were imported annually from Egypt and the Sudan, probably longer staple cottons for special uses. Much of the remainder was from various countries in Latin America.

Key Factors in U.S. Cotton Sales

Financing. U.S. financing has been a principal reason for U.S. predominance in the South Korean market. In the 1950's, practically all U.S. cotton imported by South Korea was financed under mutual security—which ended in 1961/62—or Title I, Public Law 480. Financing under Title I, Public Law 480 was the principal means from then until 1970/71, continuing as an important factor in 1971/72 and 1972/73. Since then, only relatively small quantities have been financed by this means—in 1975/76 and 1976/77 (tables 4 and 5).

Financing under CCC loans began in 1963/64 and has been the most important means of U.S. Government financing since 1970/71. A \$50.2 million line to finance approximately 145,000 running bales, announced January 5, 1979, is the most recent in a series of loans. Financing under barter programs took place from 1963/64 to 1972/73, but exceeded 50,000 bales in only 3 fiscal years.

Source: As indicated in above footnotes.

Financing under Title I, Public Law 480 was at relatively low interest rates, with long periods of repayment—at first in local currency, but beginning in 1971/72 usually in convertible currency. The 1975 and 1976 Title-I agreements called for no payments in the first 10 years and then repayment in 31 annual installments at interest rates of 2 and 3 percent. Cotton financed under Public Law 480 provided Korea with counterpart funds for irrigation, highway, power, and other projects and, of course, contributed to Korea's budgetary stability. Cotton so financed could be used only in making textiles for domestic consumption and not for export.

CCC loans have been repayable in dollars in annual repayments over 3 years. The interest rate being applied on loans in late November 1978 was 10.5 percent if guaranteed by a U.S. bank, or 11.5 percent if guaranteed by a Korean bank. Cotton mills purchasing U.S. cotton under such loans have enjoyed the benefit of the 3-year term for repayment and the relatively low interest rate.

In all, financing of U.S. cotton exports to South Korea under U.S. official programs escalated from around 200,000 bales annually in the mid-1950's to over half a million bales in some years in the 1970's.

Private financing of U.S. cotton shipments to South Korea was very limited until the early 1970's, but now is used for exports of several hundred thousand bales annually to that country. Korean mills

pay for this volume with Korean foreign exchange funds.

The Government of Korea has expressed its desire to continue Public Law 480 and CCC credit financing in 1979, and to continue to purchase its cotton requirements largely from the United States.

In certain other importing countries, purchases of cotton are sometimes part of an arrangement in which the cotton exporting country accepts manufactured products from the importing country in return for the cotton. Such deals may disadvantage the United States, where preferred entry of a country's products is not tied to U.S. cotton sales. In South Korea, financial and other advantages of purchasing U.S. cotton appear to outweigh possible advantages of purchasing cotton elsewhere. Because the Republic of Korea has no diplomatic relations with the Soviet Union, no Soviet cotton is purchased although it is an important factor in some other east Asian countries.

Dependability and Market Promotion

Over the years a good relationship has developed between the cotton spinners in the Republic of Korea and the cotton merchants, cooperatives, and cotton organizations in the United States. Several Korean

mills had financial problems in the textile recession of 1974/75, but the United States provided additional financial assistance and there were no defaults. Cotton trade between the two countries appears to have operated well with regard to delivery according to specifications, timing, and so forth. Korean mills generally consider U.S. cotton shippers to be highly dependable.

Cotton Council International (CCI) has a cooperative cotton promotion program with the Spinners and Weavers Association of Korea to promote use of U.S. cotton in Korea. In addition, it brings Korean spinner representatives to the United States for cotton orientation tours and sends U.S. trade teams to Korea. These programs are conducted under a cooperative market development arrangement between CCI and the U.S. Department of Agriculture.

U.S. cotton growing areas have the advantage of being comparatively close to South Korean mills, compared with other major cotton-exporting areas in the world, even though the shipping distance is several thousand miles. Availability in the United States of large quantities of the various staple lengths also strengthens the U.S. position in this market.

Although precise figures are not available, it appears that most South Korean cotton purchased consists of Acala cotton from the San Joaquin Valley in California and Deltapine cotton from the Imperial Valley of California and Arizona. A considerable volume of shorter staple cotton comes from west Texas and Oklahoma, but probably not very much from the Delta. The latter moves primarily to U.S. mills in the Carolinas, Georgia, and Alabama.

Most U.S. cotton destined for South Korea is exported through the ports of Los Angeles and San

Francisco, although a considerable volume moves through Galveston and Houston (table 6).

How Korean Mills Purchase U.S. Cotton

South Korean mills usually purchase their U.S. cotton through Korean agents of U.S. cotton shippers and cooperatives. One or two mills may purchase directly. Most cotton is bought on the basis of private types supplied by the shippers although a substantial business is done on the basis of the USDA official classification (green card). Cotton is usually purchased f.o.b. U.S. ports, with Korean mills specifying the ship.

Staple Lengths Purchased. The bulk of cotton bought by South Korean mills is American Upland. Two sets of statistics on U.S. exports collected by the Bureau of the Census and the Office of the General Sales Manager, USDA, indicate that in the four cotton seasons 1973/74-1977/78 around 8 percent of the Upland cotton exported to South Korea was 1-1/18" and longer in staple length. Another 45 percent was 1-3/32"; 33 percent, 1" to 1-1/16"; and 14 percent under 1" (tables 7 and 8).

U.S. export statistics indicate the export of 1,700 bales of American Pima cotton to the Republic of South Korea in 1973/74, none in 1974/75, 1,300 bales in 1975/76, and 2,400 bales in 1977/78. This cotton staple is 1-3/8" and longer. Some of the cotton purchased by South Korea from Egypt and the Sudan may also be in the extra-long staple category, but these purchases are limited to a few

thousand bales annually at most. Such statistics indicate that South Korea typically purchased U.S. cotton of average and longer staple length.

Consumption

The Textile Industry

The textile industry of the Republic of Korea—and its ability to process cotton—has been expanding in the last few years at what must be one of the most rapid rates that has ever occurred anywhere. The number of cotton system spindles rose from 902,000 in 1970 to 2,598,000 in December 1978, and was expected to rise to 3,187,000 by the end of 1979. Reportedly this number would grow to 3,508,200 when capacity under construction in 1978 was completed.² Similarly, the number of cotton-weaving looms rose from 40,838 in 1975 to 58,423 in June 1978, and was projected to expand further to 71,590 in 1980 (table 9). Also, large increases in the number of knitting machines and sewing machines were taking place. The industry is taking full advantage of the economies of large-scale operations to offset rising wage levels.

Korea's fourth Five-Year Plan for 1977-81 implies that less emphasis may be given to textiles in the future. It states: "In view of the constraints placed on

industrial-sector plans by limited savings mobilization, poor resource endowments, and steadily increasing employable population, emphasis will be placed on skilled-labor-intensive industries such as machinery, electronics, and shipbuilding. . . "Capital intensive industries such as iron and steel, nonferrous metals and petrochemicals will be established on scales large enough to ensure international competitiveness. On the other hand, the international competitiveness of light industry will be strengthened through product diversification and quality improvement."³

However, a recent newspaper article noted some disappointment with heavy industry and the possibility that Korea might concentrate again on textile expansion.⁴ The cotton textile industry in 1978 was swamped with orders after a slowdown in the fourth quarter of 1977. This was in part because of improvement in Korea's competitive position in world markets following appreciation of the Japanese yen and devaluation of the dollar. South Korea was reported to be filling the vacuum created by the withdrawal of Japanese mills in certain areas of yarn and fabric markets in Asia. A principal fear was that

eventually China would provide strong competition for low-quality products.

It was reported in the spring of 1979 that the textile industry was enjoying an unusual export boom as well as strong domestic demand. Also reported was Korea's decision to abolish ceilings on expansion of facilities in the textile industry so as to be better able to compete in world markets.

Korea may now be capable of producing cotton textiles at the lowest cost in the world. Its machinery is new and, unlike the situation in some other countries, it is concentrated in large-scale plants. Nevertheless, the industry fears that Government measures requiring use of domestically produced

machinery might interfere with the industry's

Mill Consumption

Cotton. Mill consumption of cotton in South Korea passed the 200,000-bale mark in 1956/57, 400,000 bales in 1967/68, and went over a million bales in 1975/76 for the first time. There was a drop to 909,000 bales in 1976/77, then a roaring recovery to 1.3 million bales in 1977/78. In the fall of 1978, the industry placed its cotton requirements for calendar 1979 at 1.4 million bales (table 11) and for 1980 at 1.5 million bales. South Korea now consumes more cotton at the mill level than any country in Western Europe and is the 10th largest mill consumer of cotton in the world. Of the countries depending primarily on cotton imports, it is now second only to Japan as the largest consumer.

Other Fibers

While Korean mill consumption of cotton has grown rapidly, cotton's share of mill consumption of all fibers dropped precipitously from 75.5 percent in 1965 to 37.2 percent in 1976, remaining around the latter level in 1977 and 1978. The rapid decline was

associated with development of a large domestic manmade-fiber industry. The Korean Government encouraged greater use of manmade fibers for domestic offtake, no doubt on the basis that such fibers were now produced in the country, while practically all cotton had to be imported. There was also a desire to diversify and offer a wide range of products. At the same time export markets were available to which manmade-fiber products—both 100 percent and blended—could be shipped, in contradistinction to import restrictions on cotton products imposed by a number of countries.

Consumption of synthetic fibers tripled from 1972 to 1977 and in the latter year constituted 60 percent of the fibers used. The 252,000-metric-ton gain in consumption of synthetic fibers from 1972 to 1977 compares with a gain of 111,000 tons in cotton. Wool consumption has remained around 1 percent of the total. Rayon consumption was stagnant until 1976/77, when high cotton prices caused a moderate jump, although rayon's percentage in the latter year was only 3.5 percent. Consumption of silk and linen was small: in 1976, silk yarn production was 542 tons and linen yarn production 636 tons.

Domestic Market for Cotton Textiles

Only about 25 percent of South Korea's mill consumption of cotton went into the manufacture of textiles for domestic use in 1977, compared with 71 percent in 1970. The remainder went into exported textiles.

The domestic offtake of cotton textiles appears to have been stationary from 1970 through 1977—equivalent to about 285,000 bales (62,000 tons) annually—but with considerable year-to-year fluctuations. During the first half of 1978, however, domestic offtake soared to an annual rate of 381,000 bales (83,000 tons) (tables 12 and 13). Recovery from a textile recession in the last quarter of 1977, general prosperity, and rising per capita incomes were factors in the upturn. There was also a strong demand for jeans. In July 1977 a value-added tax was imposed on all products, including textiles, but the previous tax on textiles had been higher, so the new tax actually lowered the cost of textiles to consumers below what it otherwise might have been.

Previously the domestic offtake of cotton goods may have been held back by price controls, which caused mills to divert production to more profitable exports. In August 1978 the Korean Government stopped the direct export of cotton yarn, blended yarn, and cotton cloth until adequate quantities were available to meet both domestic needs and those of manufacturers of end-use products for export.

Data on mill consumption of cotton in South Korea are from the Spinners and Weavers Association

of Korea (SWAK), which segregates its cotton mill consumption figures by whether the products made from raw cotton are for domestic use or export. This is obviously difficult to do, but a check of Korea's textile exports bears out the accuracy of the figures.

Practically all of the cotton goods used in South Korea are manufactured domestically. A small

amount of cotton yarn and a moderate amount of cotton cloth are imported, but they are probably largely processed further for export.

Competition Among Fibers. While the offtake of cotton goods changed very little from 1970 to 1977, the offtake of manmade fiber textiles rose very

rapidly from 75,000 metric tons in 1970 to 220,000 tons in 1977 on a raw fiber basis. Cotton's share of the total for the two fibers declined from 75 percent in 1965 to 28 percent in 1977, but may have recovered to 34 percent in 1978. This is on the basis of mill consumption of cotton and availability for domestic consumption of both continuous filament yarn and staple manmade fibers. On another basis—consumption of fibers on cotton system spindles—cotton's share declined from 92 percent in 1970 to 71 percent in 1977. Rayon staple's share was small and became smaller, while synthetic staple's share rose very rapidly (table 12).

Per Capita Domestic Consumption. Per capita domestic consumption of cotton and manmade fibers rose from 2.5 kilograms in 1965 to an estimated 6.6 in 1978. This compares with an average in 1974 of 3.1 kilograms for all developing countries, 14.5 in Japan, and 22.2 in the United States. Per capita domestic consumption of cotton in South Korea, however, was only around 1.8 kilograms annually during 1970-72 and 1.9 in 1976-78. This was well below the 3.1-kilogram average for all developing countries in 1974 and far below Japan's 6.3 kilograms and the United States 7.5 kilograms.

The population of South Korea rose from 33.51 millions in 1972 to 36.44 millions in 1977, an 8.5-percent gain. The population has been increasing by 58,000 per year.

Exports of Cotton Textiles

In the last few years the Republic of Korea has become one of the world's major exporters of cotton manufacturers. In 1977 it probably exported more cotton yarn than any country except Greece, Pakistan, and, likely, Turkey. Its export of 25,585 metric tons of cotton fabrics in 1977 was well below exports of a number of other countries, but were still substantial. Korea's exports of cotton made-up goods are rising, but are still small in volume, compared with exports of yarn and fabrics.

In all, it is estimated that exports of cotton in the form of manufactured goods rose from 151,000 bales (32,900 metric tons) in 1970 to 795,000 bales (188,000 tons) in 1977 and to a still higher total in 1978 (table 14). It is unlikely that any other country in these years had so rapid an increase.

Competition from Manmade Fibers. As with the domestic component of the Korean market, consumption of manmade fibers in the manufacture of export goods has gone up much more rapidly than consumption of cotton. Manmade fibers used in making textiles for export are estimated to have risen from 42,000 tons in 1970 to 256,000 tons in 1977, with a further large increase in 1978. Exports of both all manmade fiber goods and blended fabrics have risen rapidly. Cotton's share of the market for both cotton and manmades is much smaller than in

the 1960's, declining from 84 percent in 1965 to 44 percent in 1970 and 39 percent during 1976-78.

Consumption of cotton and manmade staple fibers in the manufacture of exported textiles is given in table 15. This table does not include consumption of manmade continuous filament yarn, which by its nature is not spun on textile machinery.

Kind of Cotton Goods Exported. In 1976, yarn accounted for 49 percent of the exports of cotton manufactures; fabrics, 46 percent; and made-up goods, 5 percent. Korea is thus primarily an exporter of goods in process that require further manufacture elsewhere (table 16).

Exports of cotton yarn multiplied ninefold from 1970 to 1978. Practically all of the cotton yarn exported was pure cotton. Exports of blended, part-cotton yarns remain small.

All-cotton fabric exports rose from 1970 to 1972, but then they receded and were scarcely larger in 1976 than in 1970. They accounted for over half of the exports of cotton manufacturers in 1970 but less than 20 percent in 1976. On the other hand, exports of part-cotton, blended fabrics quadrupled and their share rose from 18 to 27 percent. Such goods, although only part cotton, are becoming a significant component of cotton offtake.

Markets for Korean Cotton Manufactures. Japan was formerly the largest export market for South Korean cotton manufactures, taking around one-fourth of the total to all destinations in both 1970 and 1976. Japan is primarily a buyer of cotton yarn, accounting for 40 percent of South Korea's export of this product.

The record import of South Korean cotton yarn by Japan in 1978 was the subject of a joint meeting of the spinners' organizations of the two countries in September 1978, but no action was taken on the matter. Japan also takes nearly 20 percent of Korea's exports of cotton made-up goods and a smaller proportion of its fabric exports.

Hong Kong replaced Japan as the largest buyer of South Korean cotton textiles in 1976, taking 30 percent of total exports compared with 17 percent in 1970. Like Japan, Hong Kong is a heavy buyer of all-cotton yarn; exports shot from 2,400 tons in 1970 to 180,000 tons in 1976 and a like amount in 1977. In 1976 Hong Kong was also the destination of 10 percent of Korea's exports of all-cotton fabrics, 15 percent of the part-cotton fabrics, and as might be expected, very little of its made-up goods. Obviously, Hong Kong imports yarn and fabric from South Korea, processes it further, and largely exports the finished product. Hong Kong's relatively large import quotas into the United States and Western Europe may be important in this connection. However, since Hong Kong is a free port, Korean textiles have no difficulty entering.

The United States took 12 percent directly of South Korea's exports of cotton manufactures in 1970 and only 7 percent in 1976. The United States imports practically no cotton yarn from South Korea, but takes 14 percent of its all-cotton-fabric exports, and 9 percent of its part-cotton fabrics. The United States, however, is the largest buyer of made-up goods, which accounted for 38 percent of the volume in 1976. By far the largest item in this category was

¹ Yarn and make-up goods converted at 4.6 square yards per pound.

towels. A considerable additional volume of yarn and fabric produced in South Korea may eventually also arrive in the United States after further processing in such countries as Hong Kong and Japan.

South Korea exports little yarn to Western Europe, although there was a sudden, large export of part-cotton yarn to Austria in 1977. Western Europe, however, is the major market for Korean cotton fabric exports, taking well over half of total exports.

Next to the United States, Western Europe is the largest buyer of made-up goods from South Korea, taking over one-fourth of total exports. The volume, though gradually rising, is small compared with sales of cotton fabrics. EC imports of all-cotton fabrics have not increased much—from 43,000 tons in 1970 to 54,000 in 1976—although shipments there of part-cotton fabrics increased ninefold from 1970 to 1976. The 95,000 tons exported in the latter year to the EC accounted for nearly half of total Korean exports of this product. The European Community also took 7,000 tons of made-up goods. It is difficult to single out particular countries in the EC as larger markets than others. All appeared to be substantial buyers.

Exports of cotton and part-cotton fabrics to non-EC countries in Western Europe also rose dramatically in the 1970's. From close to zero in 1970, exports of all-cotton fabrics went to 31,000 tons, and of part-cotton fabrics to nearly 11,000 tons in 1976. Sweden and Finland accounted for much of the volume.

Exports of cotton and part-cotton yarn and fabrics to countries in the Far East other than Japan and Hong Kong rose rapidly from 1970 to 1974, but have

declined considerably since then. Shipments to this area accounted for 7 percent of South Korea's export volume in 1976. The fall-off is largely because of decreased sales to Indonesia, Bangladesh, and Sri Lanka. Taiwan, Singapore, Australia, and sometimes Burma remain substantial buyers.

Elsewhere in the world, Saudi Arabia and Iran have become moderate-sized markets for Korean textiles and small quantities go to a large number of other countries in western Asia and Africa. Poland, in 1975 and 1976, and the German Democratic Republic in 1976, bought small quantities of yarn and fabric; these were the only sales to centrally planned countries.

Prospective Future Markets. As noted earlier, the Republic of Korea has one of the most efficient textile industries in the world. The industry has large, modern units and an efficient work force, and labor costs per unit of product are relatively low. Average monthly wages in the textile industry rose from \$38 in 1971 to \$125 at the end of 1976, but labor productivity rose 64 percent during the same period. With other employment opportunities increasing, Korea's textile wages no doubt will continue to rise, but even then it is difficult to think of any other countries that might be able to rival South Korea in terms of cost-per-unit of output for several years to come. Other countries now have lower wages but do not rival South Korea in efficiency.

China obviously has great potential as a competitor in textiles, particularly since it can set export prices by fiat. But it also has a huge population in need of additional textiles, and may be disadvantaged by Government ownership and the question of

whether its mills can respond rapidly and precisely to the demands of the international textile market.

South Korea as yet supplies very little of world trade in cotton textiles. In 1976 the major exporting countries exported 525,000 metric tons of cotton yarn, of which only 40,000 came from the Republic of Korea.⁵ In 1976, the major exporters of cotton fabrics exported 893,000 tons of such fabrics, of which 42,000 came from South Korea. Thus, Korean textiles still have worlds to conquer.

Much of the world trade in textiles is now controlled by bilateral agreements between exporting and importing countries. These agreements conform to provisions of the international Multi-Fiber Arrangement (MFA) concluded under the General Agreement on Tariffs and Trade (GATT). Importing countries belonging to the MFA generally cannot impose quotas on imports unless their markets are disrupted, and if they impose quotas they must allow a gradual rise from year to year and abandon the quota if the imports are no longer a problem.

Imports of Korean textiles by the United States have been controlled by bilateral agreements for several years. The current agreement, signed on December 23, 1977, calls for limitations on imports of "yarn, fabrics, made-up and miscellaneous cotton, and manmade products" of 6.6 percent each year, which, compounded, would allow 29 percent greater imports in 1983 than in 1979.

EC imports of Korean textiles are also limited by negotiations concluded in December 1977. Although the import quotas for 1978 have been published, it is difficult to determine how they will influence South Korea's exports. The MFA usually requires an overall growth rate of at least 6 percent annually, but a smaller rate can be allowed for more sensitive items. The EC is particularly anxious to hold down its total imports of cotton yarn, cotton cloth, and a few other items, while allowing a rise of over 6 percent in other categories, such as some types of apparel.

Canada and South Korea reached an agreement in April 1978 that small increases in South Korea's exports to Canada will be allowed from 1979 through 1981.

There are many other limitations on the international movement of textiles, including tariffs and exchange limitations in many countries, state trading, and quotas in countries other than those just mentioned. The general effect is that Korea's textile exports to the developed countries will be allowed to expand at a moderate rate in the future with perhaps a slower rate of growth for cotton textiles.

South Korea is attempting at present to increase the number of countries it supplies. Its markets in

such areas as the Middle East, Africa, and Latin America are as yet very limited; import restrictions and the desire to encourage their own textile industries, to make such expansion a difficult enterprise. South Korea also is attempting to diversify its output and to increase its production of high-quality, high-style products.

Importance of Textile Exports to the Korean Economy. South Korea's export of textiles and clothing (including raw silk and raw manmade fibers) rose in value from \$1,526 million in 1974 to \$2,811 million in 1977 and an annual rate of \$3,224 million in the first half of 1978. These items accounted for 34 percent of South Korea's total exports in 1978 and 28 percent in 1977.⁶

In 1974, South Korea ranked fifth (in value) as an exporter of textiles and apparel, behind the EC, Japan, Hong Kong, and the United States. By 1977, it was fourth, having passed the United States. Deducting imports of textiles from exports to obtain a net trade balance for textiles and clothing, the Republic of Korea's positive balance of \$2,262 million in 1977 was exceeded by only one country, Japan.⁷

Imports of Korean Textiles and Apparel. U.S. imports of Korean cotton manufactures comprised around 4 percent of total U.S. imports of such products and 14 percent of aggregate U.S. imports of cotton, wool, and manmade fiber manufactures from that country (table 17). Imports of manmade fiber products, some of which contain a partial cotton content, were much more important. They comprised 83 percent of the total for all U.S. imports of the aforementioned fiber products from South Korea and about 14 percent of total U.S. imports of manmade fiber products. (These figures are based on equivalent square-yard data.)

Korea's Manmade Fiber Industry

South Korea has had one of the most rapidly expanding manmade fiber industries in the world in the 1970's. Production rose eightfold between 1970 and 1978 (tables 18 and 19). Even so, Korea had only 3 percent of the world's production in 1977. Further substantial expansion is reported to be taking place under the pressure of what the *Japan Textile News*

(November 1978) said was the "ever rising textile demand of the world market."

About 40 percent of South Korea's production of manmade fibers consists of polyester fiber, half of which is continuous filament yarn and half staple fiber. The latter is almost entirely used on cotton-system spindles and is frequently blended with cotton.

Acrylic fiber, largely used for sweaters and other wool-type products, constitutes nearly 30 percent of total production. Nylon yarn represents about 23 percent. There is a limited production of viscose and acetate, polypropylene, and nylon staple. Some expansion apparently is going on in all of these products.

Synthetic fibers have been made from intermediates purchased in Japan, the United States, and

sometimes Europe. Korea was expected to have its own production of these chemicals in 1979.

Korea's synthetic fiber industries have enjoyed a better competitive position than their counterparts elsewhere, because almost all of their product is converted into textiles and apparel before being exported. As the country's textile and clothing industries are highly efficient, their manmade fiber producers have an advantage. Some manmade fibers are still being imported, probably of types not available, or of limited availability, in South Korea. Polyester staple fiber was selling for export at 50 cents per pound in South Korea in 1977, well below the price of cotton. The domestic price, however, was 70 cents per pound, while the price of rayon staple was 72 cents.
